

BigDFT Session

Flexibilities of wavelets as a computational basis set for large-scale electronic structure calculations

Luigi Genovese

L_Sim - CEA Grenoble - France

November 17, 2022

MaX Center of Excellence

Origin of the BigDFT project

Large-Scale DFT

Luigi Genovese

STREP European project: BigDFT(2005-2008)

In the beginning: Four partners, 15 people

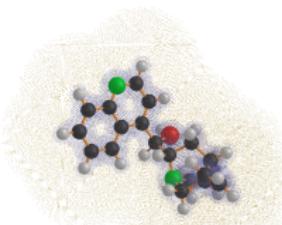

Now: around 10 active developers, Grenoble, Basel, Bristol, Catania, Trieste, Kobe

Used in production since twelve years.

Aim: To develop an ab-initio DFT code based on **Daubechies Wavelets**, to be integrated in ABINIT.

BigDFT 1.0 → January 2008

Why have we done this?

- Test the potential advantages of a new formalism
- A lot of outcomes and interesting results
- Future opportunities and ideas

The BigDFT project

Implicit Solvents

BigDFT
compilation

Perspectives

In Practice

Opportunities

A Multi-Resolution real space basis

All functions w/ compact support, centered on grid points.
In the wavelet theory we have two kind of basis functions.

Scaling Functions (SF)

The functions of low resolution level are a linear combination of **high-resolution functions**.

$$\dots \square \square \dots = \dots \square \dots + \dots \square \dots$$

Wavelets (W)

Contain the DoF needed to complete the information lacking due to the coarseness of the resolution.

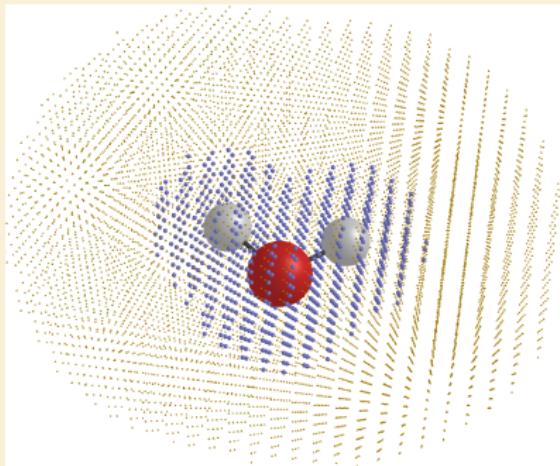

$$\dots \square \dots = \frac{1}{2} \cdot \dots \square \square \dots + \frac{1}{2} \cdot \dots \square \square \dots$$

Increase the resolution without modifying grid space

SF + W = Degrees of Freedom of SF of higher resolution

Adaptivity

Resolution can be refined following the grid point.

The grid is divided in **Low** (1 DoF) and **High** (8 DoF) resolution points.

Points of different resolution belong to **the same** grid.

Empty regions must not be “filled” with basis functions.

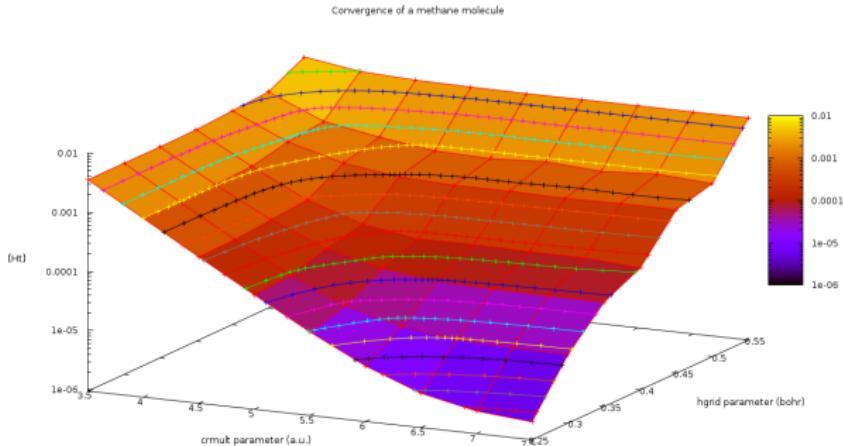

Localization property, real space description

Optimal for **big & inhomogeneous** systems, **highly flexible**

The absolute accuracy of the calculation is directly proportional to the number of the basis functions

Two parameters for tuning the basis

- The grid spacing `hgrid`
- The extension of the Low resolution points `crmult`

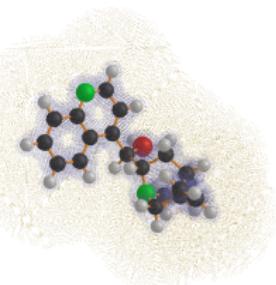

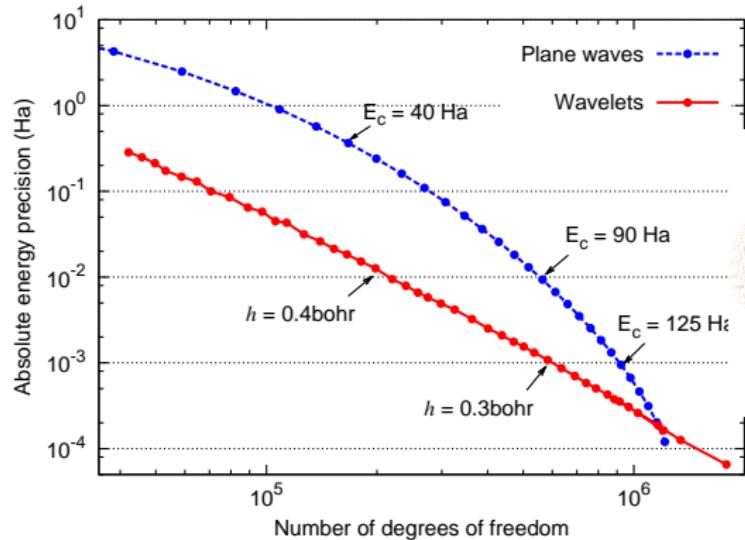

Optimal for inhomogeneous systems

Large-Scale DFT

Luigi Genovese

Test case: cinchonidine molecule (44 atoms)

The BigDFT project

Wavelets

Poisson Solver

Implicit Solvents

BigDFT compilation

Perspectives

In Practice

Opportunities

Enables a systematic approach for molecules

Considerably faster than Plane Waves codes.

the above run :10 (5) times faster than ABINIT (CPMD)

Charged systems can be treated explicitly with the same time

A DFT code conceived for HPC (www.bigdft.org)

- DFT calculations up to many thousands atoms
- 👉 An award-winning HPC code
- BigDFT has been conceived for massively parallel heterogeneous architectures since more than 10 years (MPI + OpenMP + GPU)

Prix Bull - Joseph Fourier

Pour le développement de la simulation numérique

Code able to run routinely on different architectures

- GPU accelerators since the advent of double-precision GPGPU (2009)
- Various large calculation projects since 10 years
- ✓ A code conceived for supercomputers

A flexible formalism

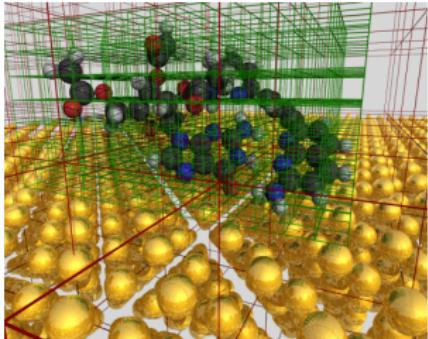

Large-Scale DFT

Luigi Genovese

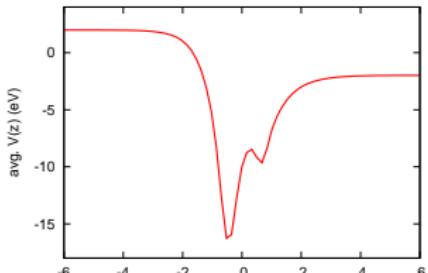

Flexible Boundary Conditions

- Isolated (free) BC
- Wires BC
- Surfaces BC
- Periodic (3D) BC

Systematic approach

Only relevant degrees of freedom are taken into account
Boundary conditions can be implemented explicitly

E.g.: Surfaces BC

2D Periodic + 1D isolated
Optimal to treat dipolar
systems **without** corrections

The BigDFT project

Wavelets

Poisson Solver

Implicit Solvents

BigDFT compilation

Perspectives

In Practice

Opportunities

A code **both** for Solid-State and Quantum Chemistry

- 3D periodic, Surfaces and Free BC (\leftarrow Poisson Solver)
- Very high precision (analytic KS operators)
- Usage of analytic HGH pseudopotentials
- AE accuracy, benchmarked in G2-1, S22, DeltaTest

Present functionalities

Traditional functionalities for GS Kohn-Sham DFT (including metals, Hybrid Functionals), LR-TDDFT, empirical VdW

Exhaustive library of Structural Prediction, $O(N)$ calculations

Modularity first

BigDFT-suite : collection of different independent libraries with own build system.

Third-party libraries (green) and upstream modules (blue)

Dependencies expressed easily in the jhbuild-based bundler.

- Lots of possible options
- Very versatile
- Python configuration files can be shared, many provided

In this training you will...

- Have an overview of BigDFT code API
- See how to employ some of the functionalities of this code from a local workstation
- Work to some pre/post processing of the code data/results
- Run some calculations BigDFT in a production environment (supercomputer)

In this training you will **not**...

- Perform a throughout overview of the functionalities
- Have lot of time to inspect code performance

Abstract

In the past decade, developments of computational technology around density functional theory (DFT) calculations have considerably increased the system sizes which can be practically simulated. The advent of robust high performance computing algorithms which scale linearly with system size has

Automatic Fragmentation of Systems

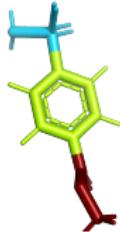

Large-Scale DFT

Luigi Genovese

Small Molecules - From Atoms Up

- Automatic: We can re-organize a system into fragments without prior knowledge.
- Robust: Non-expert DFT users can interpret the information coming out of DFT calculations.

Large Biomolecules

- Proteins are often already divided into fragments based on their Amino Acids.
- Yet not all amino acids are equally good fragments. We can combine them together to build a more coherent picture.

Quantum Mechanics (DFT) may be needed

- Whenever DFT is necessary to study the electronic structure of the systems, it is important to provide the tools to interpret experimental data
- Need of new tools developed especially for the study of biological systems
- The BigDFT code provide a new paradigm of analysis

Main ingredients

- PDB files from neutron crystallography, Cryo-TEM, MD simulations, ...
- Remotely accessible (super) computing platform
- A post-processing infrastructure easy-to-use

Pre- and Post-processing of simulations are performed via a Python module

HPC

Calculations triggered **remotely** on a super-computer from a Jupyter notebook (AiiDA framework)

Userclub

Simulation can be processed from a platform next to experimental data (ILL User Club access)

Database

Large databases of biological systems can be created

New insights for (neutron) data analysis

- Dedicated routine for neutron crystallography data interpretation
- Possible improvement from other structural (e.g. SANS) data

Summary

- DFT shouldn't be employed for large systems just on the hope of accuracy, but instead with the goal of insight.
- Complexity Reduction - We have developed a way to use information from DFT to generate coarse-grained views of a system by defining reliable fragments and measuring their interaction.

Opportunities

From Material Science to other communities

- The complexity reduction framework presented here originate from our expertise on Physics and Material Science.
- Postprocessing can be performed even by non-specialists.
- This combination create interesting opportunities for interdisciplinair collaborations.

Interdisciplinary considerations

Large-Scale DFT

Luigi Genovese

Discussion with biologists

We are not referring to a set of established techniques:

- New objects, definitions, descriptors
- The Physico-Chemical outcome (and only this!) should be highlighted

Difference (I have found) in the approach: example

- For a Physicist the procedure is the ground basis for the result
- For Biologists the result is the ground basis for the procedure

Interdisciplinarity requires

Rigor, Trust, Vision, Commitment ➔ The right guys
